AB The invention provides novel six and seven-carbon termini-differentiated polypropionate stereotetrads and stereopentads [I-XV; R1 = C1-5 alkyl; R2, R3 = H, C1-4 alkyl, or blocking group, preferably a silyl-containing blocking group such as trimethylsilyl or tert-butyldimethylsilyl group; R = Ph or substituted Ph group wherein the substituted Ph group is substituted in one instance at the o-, m- or p-position of the Ph group with C1-4 alkyl, halogen (F, Cl, Br, or iodo), NO2, NH2, HO, C1-4 alkyloxy-carbonyl, C1-4 alkoxy, or acyl group], and stereoisomers, pharmaceutically acceptable salts, solvates, and polymorphs thereof which are useful in syntheses of natural products. The invention also provides a novel alkylative sulfenylation-desulfonylation process that efficiently transforms

enantiopure epoxyvinyl sulfones to syn and anti dienylsulfides in two operations. Thus, to a solution of (1R)-3-(phenylsulfonyl)-2,4-cycloheptadien-1-ol (822 mg, 3.29 mmol) in THF (30 mL) at -78° was slowly added MeLi in Et<sub>2</sub>O (1.4 M, 5.9 mL, 8.22 mmol) over a period of 30 min using a syringe pump and the resulting orange solution was left stirring for 30 min to ensure complete reaction, rapidly treated with a solution of Ph disulfide (1.8 g, 8.22 mmol) in THF (4 mL) via cannula, warmed to 25°, left stirring for 6 h, and treated with saturated NH<sub>4</sub>Cl (50 mL) and then with Et<sub>2</sub>O (100 mL) to give, after workup and silica gel chromatog., to give 835 mg of pure (1R,2R,3R)-3-Benzenesulfonyl-2-methyl-5-phenylsulfanylcyclohept-4-enol (68% yield).

AB Alkylative sulfenylation-desulfonylation efficiently transforms an enantiopure epoxyvinyl sulfone into syn and anti dienyl sulfides in two operations. This reaction permits the functionalization of all seven atoms of a cycloheptane system, eventually leading to polypropionate stereotetrads and stereopentads for use in natural product synthesis.

AB Conversion of  $\eta^4$ -cycloheptatriene- $\text{Fe}(\text{CO})_2\text{P}(\text{OPh})_3$  to ketocycloheptadiene- $\text{Fe}(\text{CO})_2\text{P}(\text{OPh})_3$  complex I was accomplished by hydroboration followed by Swern oxidation. Methylation and hydroxylation of the enolate from I proceeds with complete stereoselectivity, anti to the metal moiety, and introduction of two Me or hydroxyl groups at the  $\alpha$  and  $\alpha'$  positions was accomplished in high overall yield. Reduction of the ketone group on these complexes occurs with high stereoselectivity and is controlled by the boat conformation adopted by these complexes. The products of these reaction sequences were demetalated to give cycloheptadiene derivs. that were further functionalized to give a
